Design Thinking Project Report Requirements

Project Report Requirements and Structure

- The project report must describe the work done, including all evidence such as prototype designs, testing results, pictures, and simulations.
- It should detail each step and phase of a selected design thinking approach, supported by specific evidence for each phase.
- The standard length is 12-15 pages, with additional evidence (pictures, tables, surveys) allowed in an appendix without page limits.
- The report must follow an official guideline for structure and formatting, including a title page, table of contents, lists of figures/tables/abbreviations, introduction, main body, conclusion, reference list, and appendix.
- The main body has all the phases corresponding to the design approach you choose, eg, in case you choose the first approach of Field Guide to Human-Centered Design, then the following phases should be clearly defined as 1) Inspiration, 2) Ideation, and 3) Implementation.
- "If it looks like a research essay or a case study analysis, the project report will fail."

Project Scope and Deliverables

- Students have complete freedom to choose any product or service idea, with past examples including food, candles, software designs, apps, and medical pills.
- The project's focus is to demonstrate the product development process, culminating in a final prototype or design.
- The final design or prototype must be included in the project report as it constitutes the exam; market promotion or sales strategies are not required.

Generative AI Tool Usage Guidelines

- Generative AI tools, such as ChatGPT, can be utilized to create graphics, simulate scenarios, or generate data for qualitative user research.
- These tools are valuable for gaining insights into user bases and their thought processes, and the generated data can be used in the testing or prototype phase.
- If used, AI tools must be cited and referenced, including the prompt used, and a short reasoning for their application must be provided.
- The use of AI should add value without replacing the report's content, and plagiarism (including AI-generated content without citation) should result in "close to zero" similarity on Turnitin.
- It is also important to use real users to collect feedback in conjunction with AI-generated data.
